

Seven Benefits of Installing Window Film

Decrease Heat

Window film is the most efficient way to reduce unwanted solar heat transferring through your windows. It can provide up to 81% solar heat rejection versus untreated glass, while controlling hot spots, cooling off sun-drenched areas, balancing interior temperatures and providing exceptional daytime privacy.

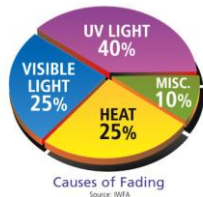

Cut Glare

Whatever the cause – direct sun, reflections from snow, water, sand, roadways or surrounding buildings—there is a perfect window film solution to help reduce annoying glare.

Save Energy

Reducing temperature imbalances caused by extreme sunlight is why so many designers, architects and building engineers insist on window film. Reducing heat loss will improve HVAC efficiency and lower energy costs.

Reduce Fading & Health Risks

Window film blocks up to 99% of UV rays and significantly decreases heat. Reducing UV rays helps protect your valuable art and interior furnishings from fading, and provides a “suntan” for your skin and eyes against the harmful effects of the sun.

Increase Safety

Accidents, environmental effects, and vandalism can instantly turn a pane of glass into life-threatening shards. Window film can act as a “safety net” by holding shattered glass together.

Enhance Appearance

Whether it’s a contemporary look or a uniform design, there’s a choice of window film that can aesthetically compliment the exterior of any home, apartment or office.

It's Fast & Hassle-Free

Installing window film is much easier and less expensive than replacing existing glass. Professional installation is quick and easy. There is minimal disruption to your daily lifestyle or work schedule.
